

PNG SIP GATEWAY LD

SIP GATEWAY LONG DISTANCE

Unlike many current IP services offered today, PowerNet Global's SIP Gateway Long Distance does not require the purchase of expensive IP equipment. The service allows businesses to gain the advantages of IP telephony while utilizing their existing legacy phone equipment.

In addition to this convenient feature, the revolutionary service provides two T-1's worth of call capacity on one circuit, permitting 46-48 channels of simultaneous calls. This allows heavy call center traffic and high calls per second, all at a significant cost savings.

PowerNet Global's SIP Gateway Long Distance service works by supplying businesses with a T-1 DIA circuit (or Private Line circuit, if requested) and gateway device that converts calls to SIP and terminates them on PNG's network. This includes outbound LD calls and inbound toll-free service.

KEY FEATURES:

- No expensive IP equipment to purchase
- One circuit allows 46-48 lines of traffic
- Includes inbound toll-free service

By taking advantage of this offering, agents can bring businesses the flexibility and affordability of advanced, next-generation services without the additional costs that typically come with IP telephony.
